Hibernate
Lombok

Lombok

- Lombok lets you add an **annotation** to turn any Java Class into a **JavaBean**
 - Generates getters / setters, toString, equals, constructor
 - Can also generate more boilerplate stuff, see:
 - <https://projectlombok.org/features/>
- You do need to **install support** for it in you IDE

```
package cs544.lombok;

public class Test {
    private String text;

    public NoLombokTest() {}

    public String getText() { return text; }
    public void setText(String text) { this.text = text; }

    @Override
    public int hashCode() {
        ...
    }

    @Override
    public boolean equals(Object obj) {
        ...
    }

    @Override
    public String toString() {
        ...
    }
}
```

```
package cs544.lombok;

import lombok.Data;

@Data
public class Test {
    private String text;
}
```
